10 Gordon et al. in U.S. Patent 4,514,391 disclose hydroxy substituted peptide compounds of the formula

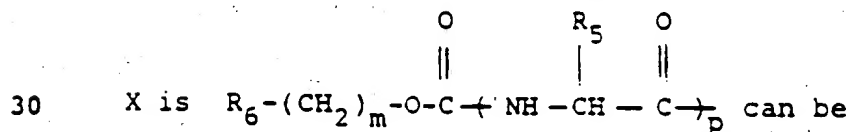

20 which possess angiotensin converting enzyme or enkephalinase inhibition activity.

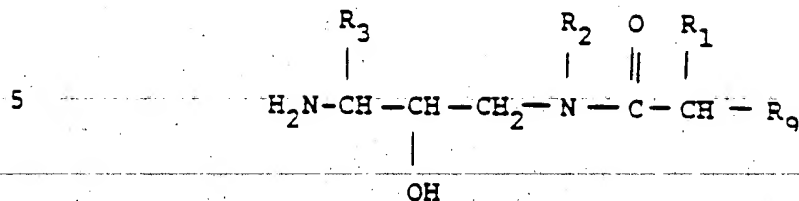

This invention in its broadest aspects relates to the compounds of formula I above, to compositions and the method of using such compounds as antihypertensive agents.

25

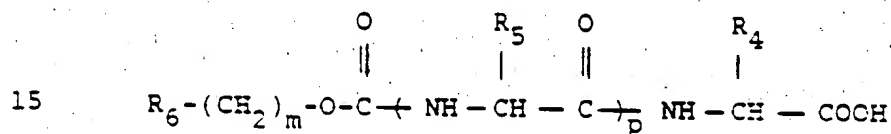

The compounds of formula I wherein

prepared by coupling an alcohol of the formula  
(II)

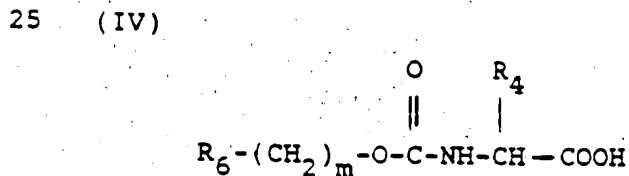

preferably the hydrochloride salt thereof with  
10 a peptide of the formula  
(III)

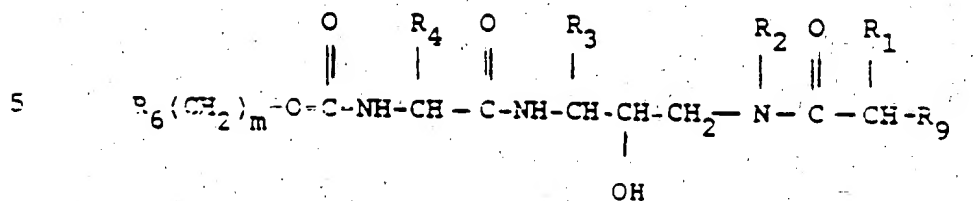

This reaction is preferably performed in a solvent  
such as dimethylformamide and in the presence of  
hydroxybenzotriazole, diisopropylethylamine, and a  
20 coupling agent such as dicyclohexylcarbodiimide.

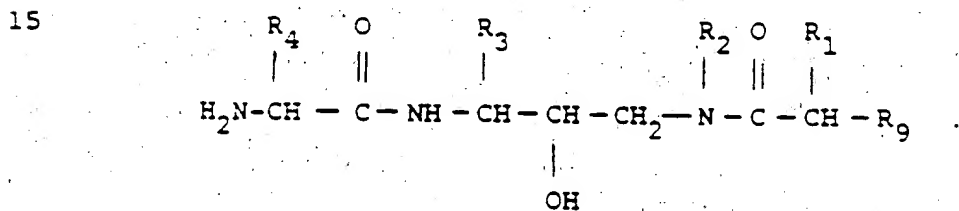

The corresponding compounds of formula I  
wherein p is zero can be prepared by coupling  
the alcohol of formula II with the amino acid of  
the formula

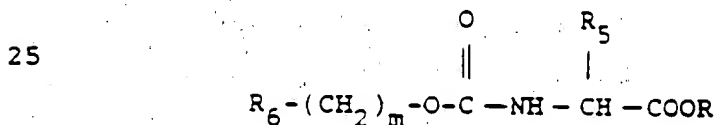

to yield the products of the formula  
(V)

When  $\text{R}_6$  is t-butyl or benzyl, then the product of  
formula V can be treated so as to remove the  
t-butoxycarbonyl or benzyloxycarbonyl group such  
as by the use of hydrochloric acid when  $\text{R}_6$  is  
t-butyl to yield the amine of the formula  
(VI)

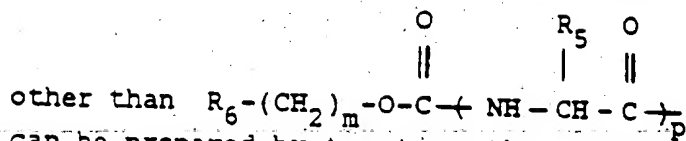

Coupling with the amino acid of the formula  
(VII)

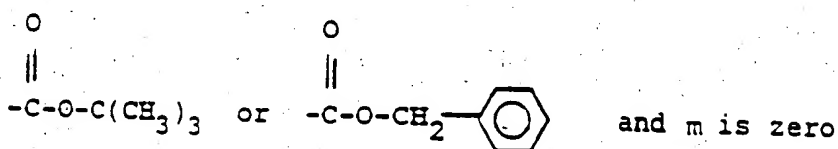

yields the products of formula I wherein  
p is one.

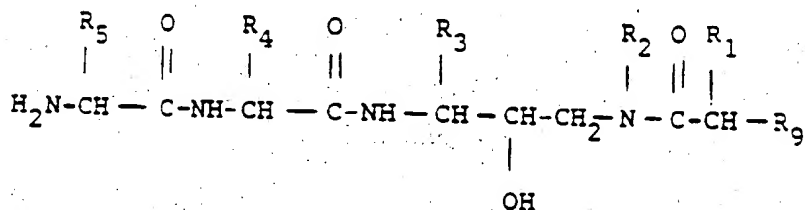

The compounds of formula I wherein X is

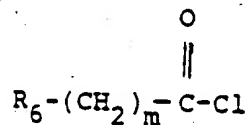

can be prepared by treating the product of formula I wherein R<sub>6</sub> is

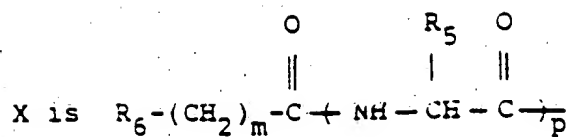

to remove the t-butoxycarbonyl or benzyloxycarbonyl group and yield the intermediates of the formula (VIII)

The amine of formula VIII or VI is treated with the acid chloride of the formula (IX)

in the presence of triethylamine to yield the products of formula I wherein

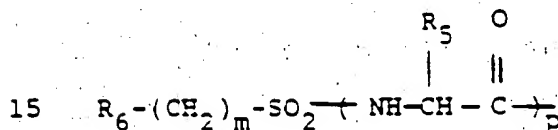

5

The amine of formula VIII or VI is treated with the substituted sulfonyl chloride of the formula (X)

10

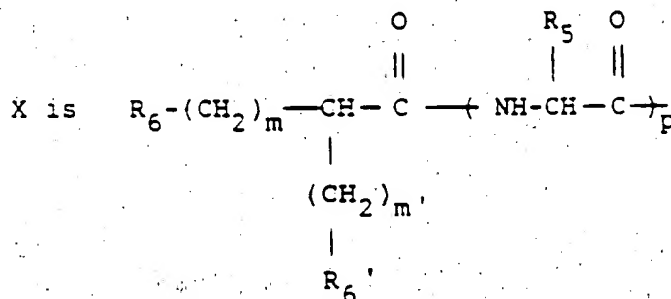

to yield the products of formula I wherein X is

15

The products of formula I wherein

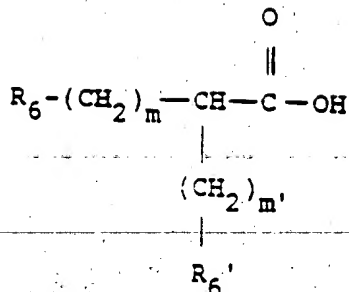

20

25

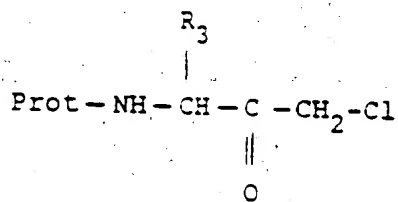

can be prepared by coupling the carboxylic acid of the formula

(XI)

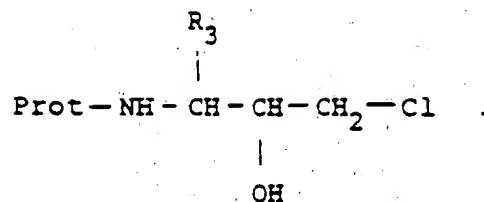

10 to the amine of formula VIII or VI in the presence  
of dicyclohexylcarbodiimide and 1-hydroxybenzo-  
triazole hydrate. Alternatively, the acid of  
formula XI can be converted to the acid chloride  
and this acid chloride can then be coupled to the  
15 amine of formula VIII or VI in the presence of  
triethylamine and tetrahydrofuran or water and  
sodium bicarbonate.

When  $\text{R}_2$  is hydrogen, the alcohol of formula II  
can be prepared as follows. A chloromethylketone of  
20 the formula  
(XII)

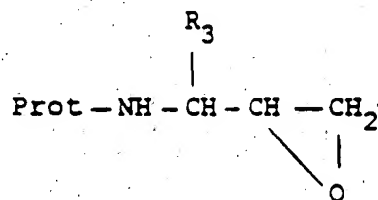

25 is treated with a conventional reducing agent  
such as sodium borohydride, diisobutyl aluminum  
hydride, lithium tri t-butoxy aluminum hydride,  
etc., wherein Prot is a amino protecting group  
30 such as t-butoxycarbonyl, to give the chloromethyl  
compound of the formula

(XIII)

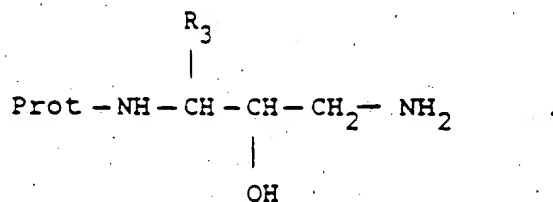

Treatment with sodium hydride gives the epoxide of the formula

(XIV)

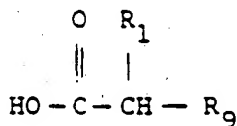

which is then treated with ammonia/methanol solution to give the aminomethyl alcohol of the formula

(XV)

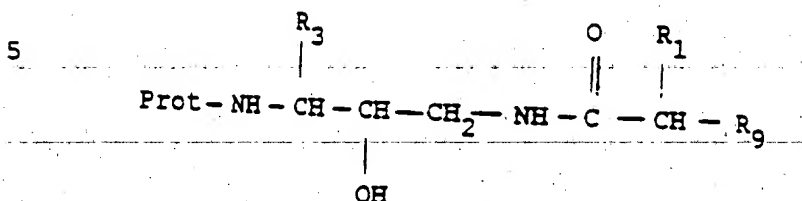

The carboxylic acid of the formula

(XVI)

is coupled to the aminomethyl alcohol of formula XV to give the alcohol of the formula (XVII)

10 This reaction is performed in the presence of hydroxybenzotriazole hydrate and a coupling agent such as dicyclohexylcarbodiimide. Alternatively, the acid of formula XVI can be converted to its acid chloride or other activated form which can  
15 then be used to acylate the aminomethyl alcohol of formula XV and give the alcohol of formula XVII.

The alcohol of formula XVII is treated to remove the Prot group such as by treatment with hydrochloric acid when Prot is t-butoxycarbonyl and  
20 give the alcohol of formula II.

When  $R_2$  is other than hydrogen, the epoxide of formula XIV is treated with the amine of the formula  
(XVIII)

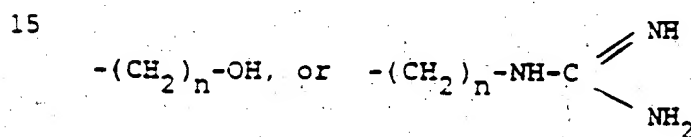

followed by treatment with the acid or activated form of the acid of formula XVI to give the corresponding alcohol of formula XVII wherein  $R_2$  is other  
30 than hydrogen. The Prot group is removed as described above to give the alcohol of formula II.

The alcohol of formula II wherein  $R_3$  is cyclohexylmethyl can be prepared by treating the aminomethyl alcohol of formula XV wherein  $R_3$  is benzyl with platinum oxide. The resulting cyclohexylmethyl compound is then reacted with the acid or activated form of the acid of formula XVI as described above.

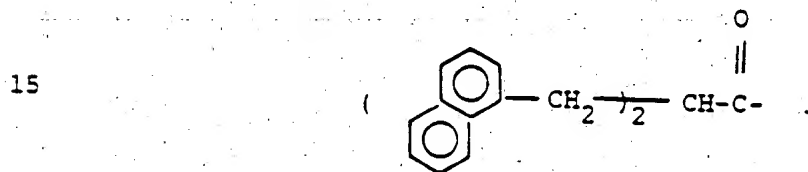

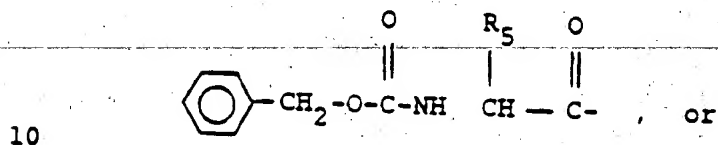

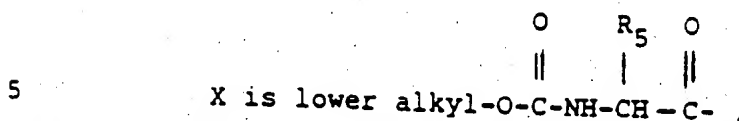

In the above reactions, if any of  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ ,  $R_5$ ,  $R_{11}$  or  $R_{12}$  are  $-(CH_2)_n$ -aryl wherein aryl is phenyl, 1-naphthyl, 2-naphthyl substituted with one or more hydroxy or amino groups,  $-(CH_2)_n$ -heterocyclo wherein heterocyclo is an imidazolyl,  $-(CH_2)_n$ -NH<sub>2</sub>,  $-(CH_2)_n$ -SH,

then the hydroxyl, amino, imidazolyl, mercaptan, or guanidinyll function should be protected during the reaction. Suitable protecting groups include benzyloxycarbonyl, t-butoxycarbonyl, benzyl, benzhydryl, trityl, etc., and nitro in the case of guanidinyll. The protecting group is removed by hydrogenation, treatment with acid, or by other known means following completion of the reaction.

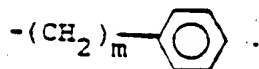

The various peptide intermediates employed in above procedures are known in the literature or can be readily prepared by known methods. See for example, The Peptides, Volume 1, "Major Methods Of Peptide Bond Formation", Academic Press (1979).

R<sub>3</sub> is  $-\text{CH}_2\text{CH}(\text{CH}_3)_2$  or  $-\text{CH}_2\text{-cyclohexyl}$ .

25 The compounds of formula I form salts with a variety of inorganic and organic acids. The non-toxic pharmaceutically acceptable salts are preferred, although other salts are also useful in isolating or purifying the product. Such  
30 pharmaceutically acceptable salts include those

formed with hydrochloric acid, methanesulfonic acid, sulfuric acid, acetic acid, maleic acid, etc. The salts are obtained by reacting the product with an equivalent amount of the acid in a medium in which the salt precipitates.

In addition, the compounds of formula I

wherein  $R_9$  is  $\begin{array}{c} \text{O} \\ \parallel \\ -\text{C}-\text{R}_{13} \end{array}$  or

10

$R_{10}$  is  $-\text{CH}-\text{C}-\text{NH}-\text{CH}-\text{C}-$  and  $R_{13}$  is hydroxy form acid addition salts when treated with a salt forming ion. Suitable salt forming ions include alkali metal salt ions such as sodium and potassium and alkaline earth metal salt ions such as calcium and lithium.

15

The compounds of formula I contain asymmetric centers when any or all of  $R_3$ ,  $R_4$ ,  $R_5$ ,  $R_{11}$ , and  $R_{12}$  are other than hydrogen and at the carbon to which the -OH group is attached. Thus, the compounds of formula I can exist in diastereoisomeric forms or in mixtures thereof.

20

The above described processes can utilize racemates, enantiomers or diastereomers as starting materials. When diastereomeric products are prepared, they can be separated by conventional chromatographic or fractional crystallization methods.

25

The compounds of formula I, and the pharmaceutically acceptable salts thereof, are anti-hypertensive agents. They inhibit the conversion of angiotensinogen to angiotensin I and therefore, are useful in reducing or relieving angiotensin related hypertension. The action of the enzyme renin on angiotensinogen, a pseudoglobulin in blood plasma, produces angiotensin I. Angiotensin I is converted by angiotensin converting enzyme (ACE) to angiotensin II. The latter is an active pressor substance which has been implicated as the causative agent in several forms of hypertension in various mammalian species, e.g., humans. The compounds of this invention intervene in the angiotensinogen  $\rightarrow$  (renin)  $\rightarrow$  angiotensin I  $\rightarrow$  (ACE)  $\rightarrow$  angiotensin II sequence by inhibiting renin and reducing or eliminating the formation of the pressor substance angiotensin II. Thus by the administration of a composition containing one (or a combination) of the compounds of this invention, angiotensin dependent hypertension in a species of mammal (e.g., humans) suffering therefrom is alleviated. A single dose, or preferably two to four divided daily doses, provided on a basis of about 100 to 1000 mg., preferably about 250 to 500 mg. per kg. of body weight per day is appropriate to reduce blood pressure. The substance is preferably administered orally, but parenteral routes such as the subcutaneous, intramuscular, intravenous or intraperitoneal routes can also be employed.

The compounds of this invention can also be formulated in combination with a diuretic for the treatment of hypertension.

5 A combination product comprising a compound of this invention and a diuretic can be administered in an effective amount which comprises a total daily dosage of about 1000 to 6000 mg., preferably about 3000 to 4000 mg. of a compound of this invention, and about 15 to 10 300 mg., preferably about 15 to 200 mg. of the diuretic, to a mammalian species in need thereof. Exemplary of the diuretics contemplated for use in combination with a compound of this invention are the thiazide diuretics, e.g., chlorothiazide, 15 hydrochlorothiazide, flumethiazide, hydroflumethiazide, bendroflumethiazide, methyclothiazide, trichloromethiazide, polythiazide or benzthiazide as well as ethacrynic acid, ticrynafen, chlorthalidone, furosemide, musolimine, bumetanide, 20 triamterene, amiloride and spironolactone and salts of such compounds.

The compounds of formula I can be formulated for use in the reduction of blood pressure in compositions such as tablets, capsules or elixirs 25 for oral administration or in sterile solutions or suspensions for parenteral administration. About 100 to 500 mg. of a compound of formula I is compounded with physiologically acceptable vehicle, carrier, excipient, binder, preservative, 30 stabilizer, flavor, etc., in a unit dosage form as called for by accepted pharmaceutical practice.

The amount of active substance in these compositions or preparations is such that a suitable dosage in the range indicated is obtained.

f) N-[N-[(1,1-Dimethylethoxy)carbonyl]-L-phenylalanyl]-1'-[(phenylmethoxy)methyl]-L-histidine

Thionyl chloride (27.2 ml., 375 mmole) is added in drops to a stirred solution in an ice-bath of L-histidine (38.75 g., 240 mmole) in methanol (500 ml.). After 15 minutes the ice-bath is removed and the reaction mixture is stirred at room temperature for one hour. After refluxing for 48 hours, it is concentrated in vacuo. The separated crystals are filtered using methanol for washings to 48.93 g. of L-histidine, methyl ester.

dihydrochloride. The methanolic solution on dilution with ether affords an additional 10 g. of product; m.p. 208 - 209°;  $[\alpha]_D^{22} = +10.1^\circ$  (c = 1.8, water).

20        66.9 mmole) in dry methylene chloride (156 ml.) and the reaction mixture is stirred at room temperature for 5 hours. After concentrating in vacuo and on dissolution in ethyl acetate 17.85 g. of N-[(1,1-dimethylethoxy)carbonyl]-1'-[(phenyl-methoxy)methyl]-L-histidine, methyl ester, mono-  
25        hydrochloride crystallizes out; m.p. (148°) 152 - 153°;  $[\alpha]_D^{22} = -19.5^\circ$  (c = 1.8, methanol). This methyl ester product is dissolved in hydrogen chloride in acetic acid solution (60 ml., 1.5 N  
30        and kept at room temperature for 15 minutes. It is then evaporated in vacuo and the residue is
